CARBOFEN ® 6060
Anionic Bitumen Emulsifier

PRODUCT DESCRIPTION
Carbofen 6060 is derived from a natural resin that has been especially modified to form an emulsifier that can be used to produce high quality anionic bitumen emulsions. The resin is obtained from a special resinous part of the Araucaria angustifolia, also known as the Parana Pine. In addition, Carbofen 6060 has a chemical composition similar to the oxidized gum resin and performs well in waterproofing products, roofing, sealants, adhesives, coatings, etc....

SPECIFICATIONS

| Acid Number, ASTM D-465 (mg KOH/g) | 80 – 105 |
| Softening point, ASTM E-28 (B&R ºC) | 95 – 120 |

ADVANTAGES OF CARBOFEN 6060 AS AN ANIONIC BITUMEN EMULSIFIER:
- High quality bitumen emulsions can be readily made;
- SS and MS type asphalt mix well with our aggregate;
- The viscosity of the asphalt emulsion is well within specification compliance;
- The emulsifier has excellent solubility in water once saponified;
- No need to use preservatives after neutralization;
- The formulations are cost effective.

DIRECTIONS FOR USE:
Asphalt emulsions are prepared from the sodium or potassium soap solution of Carbofen 6060. The solution is used to make slow set (SS) and medium set (MS) emulsions.

To prepare the Carbofen 6060 Emulsifier Solution, place 50% of the total amount of water to be used in a suitable tank and add the appropriate amount of sodium hydroxide while maintaining moderate agitation (see Table 1). Then, heat the caustic solution to 85-90 °C (185-195 °F) and slowly add our product while stirring for 30-45 minutes. Lastly, add the remaining water and adjust the desired temperature for the production of the emulsion, typically in the range of 40-50 °C (105-125 °F).

Important: If the soap solution was prepared properly, all sodium hydroxide flakes should be dissolved. Also, the finished pH should not be below 11.5.

Table 1 Example Formula for Carbofen 6060 Emulsifier Solution

<table>
<thead>
<tr>
<th>Product</th>
<th>Weight %</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbofen 6060</td>
<td>1 – 3%</td>
</tr>
<tr>
<td>Caustic Soda (NaOH at 99%)</td>
<td>0.2 – 0.58%</td>
</tr>
<tr>
<td>Water</td>
<td>Complete to 100%</td>
</tr>
</tbody>
</table>

Note: When potassium hydroxide is used, the amount of caustic soda should be adjusted to reflect the difference in the molecular weights of NaOH and KOH. This difference can be calculated by dividing the amount of NaOH by its molecular weight (40) and then multiplying the result by the molecular weight of KOH (56.1).

The amount of emulsifier may be adjusted for the desired purpose. For SS type emulsions, the required emulsifier in the soap solution should be about 2.7 – 3.0% and for MS type emulsions, the required emulsifier should be between 1.5 – 2.6%.

Heat the emulsion base asphalt up to 130-140 °C (270-285 °F) and recirculate. Heat the Carbofen 6060 Soap Solution to 40-50 °C (105-125 °F) and recirculate. Follow the plant operation instructions.

Note: The temperatures of the asphalt and soap solution may vary beyond the limits shown here as long as the temperature of the finished emulsion is at least 5 °C (48 °F) below the boiling point of water at the altitude at which the emulsion is produced.

Below is the range of the formulation ingredients, the exact values of which will depend on the type of emulsion being prepared and the source of the asphalt:

Table 2 Example Formulation for an Asphalt Emulsion

<table>
<thead>
<tr>
<th>Product</th>

</thead>
<tbody>
<tr>
<td>Carbofen 6060 Emulsifier Solution</td>
<td>43% - 30%</td>
</tr>
<tr>
<td>Asphalt</td>
<td>57% - 70%</td>
</tr>
</tbody>
</table>

Important: The amount of Carbofen 6060 in the soap solution will depend upon the source of the asphalt and the type of emulsion to be produced. The exact formulation can be determined with laboratory evaluation.

For medium-setting emulsions, it may be necessary to use an excess of 0.2 % sodium hydroxide (NaOH) in preparing the Carbofen 6060 soap solution.

Mixing the finished emulsion by aeration should be avoided as it may cause foaming.

SOLUBILITY
- Soluble in acetone, ethanol and ethyl acetate.
- Insoluble in petroleum ether and water.

PACKAGING
- Paper bags of 25 kg (55 lbs)
- Big Bags of 840 kg (1900 lbs)
- We recommend storage in dry and fresh places.

PRODUCT SAFETY INFORMATION
Please read our Safety Data Sheet (SDS) for more information.

COMPLEMENTARY INFORMATION

**Formula 1 Temperature for the Unloaded Emulsion:**

The temperature of the emulsion exiting the mill may be calculated by the following formula:

\[ T_E = \frac{T_A \cdot P_A - 0.5 + T_S \cdot (100 - P_A)}{(100 - P_A) + P_A \cdot 0.5} \]

And assuming that the specific heat of the asphalt is 0.5 and of the soap solution is 1

**Formula 2 Volume Correction for Emulsion:**

For an emulsion designated by ASTM as group 0, specific weight at 60°F higher than 0.966, the volume variation by temperature may be calculated by following formula:

\[ V_{60°F} = V_{TE} \cdot (2.500E - 04 \cdot T_E + 1.015) \]

**Formula 3 Changing the Concentration of Caustic Soda Utilized:**

When using sodium hydroxide with a concentration different from that shown in Table 1 (NaOH at 99%), it is necessary to adjust the amounts. The new percentages may be calculated by the following formula:

\[ N_{W%} = \frac{N_{W%} \cdot 99 - O_{W%} \cdot N_{CW}}{N_{CW}} \]

Then, the new quantities to be used can be found in Table 3:

Table 4  Simplified model of the Directions for Use. (We recommend the thorough reading of the procedure contained in page 1)

**1ST STEP**

Water (1/2) → NaOH → Carbofen 6060 → Slow → Water (1/2) → pH = 11.5 → Solution of Carbofen 6060

T = 185-195ºF

**2ND STEP**

SOLUTION OF CARBOFEN 6060 → ASPHAT

COLLOID MILL → EMULSION

D = 3.7 μm
